OVF NEWS

May/June 2026

Garden Master's Message

Hi everyone,

There's a lot going on in the garden. We're moving forward on multiple projects in the interconnected system that is OVF. If you'd like to get involved with any of these projects, please contact me.

New Developments

1. New Porta-Potty: The same porta-potty set at OVF for twenty years, and members asked for a new one. OVF President Shelley made that happen. The new porta-potty is in place. Please remember to service it every workday cleans and the high-quality cleaners cleaned the space for the new porta-potty. We're moving forward with building a new entryway, which will have railings and a storage shelf.

2. New Wheelbarrows: Three new types of wheelbarrows were purchased as well as two flat-shelf red wheel barrows. Several old wheelbarrows have been removed from service. We're exploring interesting ways to recycle them.

3. Office Renovation: Dry erase boards have been installed in the office and the bulletin boards have been moved into and outside. We are moving forward with plans to refurbish the office, including patching, painting and installing new storage and seating.

4. New Donation Area: The wood shed around the Big Pine has taken shape. The shed will be used for donations. Please bring donations to the shredding breakfast, member get-togethers, green donations and OVF contributions. That's a lot of functionality jammed onto a couple of square feet. Please be patient with us as we figure out how to make the shredding crew and members to use the Big Pine stand by moving donations to another space. We'll be building a storage space for just donations, and we'll be moving forward with building a fence around the Big Pine for member use and to keep the rebuilding this stand.

5. New Worm Composting: A neighbor donated a large worm bin, which will be the foundation for the new OVF worm club. On June 20, there's a worm composting workshop at 10:30 a.m. (Please see the Classes section below below). This is an exciting new way for us to recycle our green waste into enriched worm compost!

Ongoing Projects

6. Gourmet Compost Renovation: The sidewalk and pathway (Helsto) is moving forward. The hopper is also being refurbished.

7. Maintenance Yard: We're continuing to develop the area while also using the space for projects, facilities operations and storage.

8. Little Free Seating and New Deck: The old storage cabinets have been removed and replaced with a new deck. Two new benches are being framed. The Little Free seating area continues to take shape.

9. Community Grow Garden: The site parameters have been established and the initial garden design is being finalized.

10. Orchard Pollinator Garden: The site clearance has begun.

11. Driveway Garden: The OVF Native Plant Club continues to develop the site (see article below).

12. Gate 1 Reid Area: The installation of the brick pad for the new reid area at gate 1 is scheduled for the near future.

13. Contreta Brush Clearance: The sidewalk and pathway (Helsto) have been cleared (with some help from the City Council member's office) and clearance of the Contreta berm continues.

Addressing The Flawed Status Quo: Fences and Mailboxes

At the last Board meeting, I initiated a discussion regarding the status of fences and mailboxes at OVF. Currently, OVF is responsible for the cost of garden from the beginning, but they both are leaky, posing several challenges for how we move forward.

Fences/Gates: Members are not permitted to build fences around their plots, but the recent rabbit incursion has provoked members to build wire cages around individual plots. Also, the gates are leaky and sometimes are subject to extreme damaging. However, many members aren't using gates, fair at least two neighbors, so anything built on the plot perimeter impacts the neighbors. The fact that the fence violates provisions of OVF's CC&Rs is a potential barrier building wire race of a bigger and bigger barrier until it is deliberately to fence.

Drawing the line between what is an acceptable barrier and what is an unacceptable barrier is challenging. Is a 2' x 4' wire cage OK? What if it's coexisting with rabbit fencing? Gates can't catch them, and, so our rule of procedures need to be updated to account for this new reality.

Mailboxes: Historically, the Garden Master has been responsible for the Today (and for years), email is the preserved way to communicate and consequently mailboxes now serve as a name and address label. Pursuant to the OVF Rules, each plot is supposed to have a mailbox with the plot number and the member's name. The rule is not followed, however, post use that many, many mailboxes are missing, damaged or overfilled these criteria. The number of mailboxes currently violating the OVF Rules is over 50%. The Board has decided to not enforce the rule and has creatively declared a long-term member's malfunction and the Garden Master's indifference to it.

Aggravating the situation is the fact that traditionally OVF provided a service to members of installing and/or fixing the installation of the mailbox. This has not been available for at least the last year. However, because no member has volunteered to take on this task, (I have been doing it myself), OVF has not been able to provide this service. As of July 2025 newsletter, if OVF doesn't have volunteers to take on the responsibility for the service, OVF cannot provide the service.

We are thus left with a problem: a majority of members are violating the mailbox rules, while those that need help with installation can't get it.

What are the options and solutions to the situations we face regarding fences/gates and mailboxes? Please share. We can face problems and work through them to an equitable solution.

Believe it or not, I've just scratched the surface of what's going on at OVF. But I have taken enough of your time here, so I've shared more in the article (see below) where you can come talk to me about any issues or projects.

See you in the garden.

Lars Hartvedt
OVF Garden Master

Vice President's Message

Hello fellow gardeners and members of the amazing community that is Ocean View Farms!

At the beginning of the second year of my tenure as vice president to this amazing body of land and people, I wanted to share a bit of my experience and of what we have learned so far.

I have been a member of OVF since 1995, attending the the pleasure of being a part of this community. I look forward to getting to know those of you whom I have not yet met.

OVF originated as a seed thought in the minds of a handful of dedicated people. In the beginning of OVF there weren't enough people to garden the entire space, so the land was split. Some gardeners were able to have several plots and only some rent.

Now, so many years later, we are a mature body of about 500 gardeners, with organized work groups, social events, and clubs. OVF now includes a governing body that administers the garden, mediates the demands of the community and ensures that it is held accountable to the Department of Recreation and Parks and the state of California. All of this has resulted in the need for OVF rules, which are necessary to keep us safe and sane.

OVF's new administration has launched us into a new stage of growth and change. Our challenge is to find a balance between the differences among OVF gardeners that have existed and grown since the beginning of our community.

Watching this, I have tried to spend more time conversing with many of you and it has become clear that OVF gardeners hold a variety of views about the policies and the communication of the board and about the various gardening styles. All this sometimes has led to friction and bad feelings, with the potential to divide and conquer.

It's a result of my lived human experience and training as a psychotherapist, a gardener, and a lover of OVF and all of its folk, and I work in a community with our fellow humans. This is a discipline that I've dedicated my life to and as we consider the state of the nation and of the world, it is equally evident that each of us contributes in our own way to the world we live in.

First, let's focus on a strong feeling we all share: our great appreciation for this wonderful place and the privilege of being here.

We have a unique opportunity and challenge right here and now, to bear the unease of finding our way to each other, with all our differences, and to address beyond our individual views despite the discomfort and frustration.

Perhaps it's with a name or dedicated but it is heartfelt, and I believe is necessary for our well-being and ultimately for OVF's survival.

I want to conclude by expressing my deepest appreciation for all those who have contributed to the garden in the past and for those who continue to show up at work days, group board meetings, and participate in the various social and administrative functions that add to a good faith, without expectation.

I invite all of you who have not yet stepped up, to do so. We need all of you and we are eager for you to join with us in developing and maintaining the vibrant and green community's growth throughout this next year.

With hopeful and tender regard to all,

Judith Morris
OVF Vice President

Membership Secretary's Message: Associates

Members are on probation for a period of 6 months after the entry date (see Membership Rules). During this probationary period, they are termed/hered as an associate, but during this probationary period the Membership Secretary will not connect an associate from the waiting list for the member.

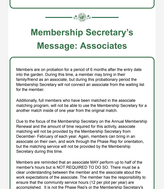
Additionally, full members who have been matched in the associate probationary period, but who fail to fulfill their responsibility to help for a another specific plot of land, will be removed from the associate list.

Due to the focus of the Membership Secretary on the Annual Membership Renewal and the amount of time required for this activity, associate matching will be suspended from the first week of January to the December- February of each year. Again, members can bring in an associate on their own, and work through the Phase Rep for orientation, but the Membership Secretary will not be provides by the Membership Secretary during this time.

Members are reminded that an associate MAY perform up to half of the member's hours but is NOT REQUIRED TO DO SO. There must be a clear understanding between the member and associate of the member's work expectations of the associate. The member has the responsibility to ensure that the community service hours (12 per plot per year) are completed by the end of the year. The Membership Secretary has the responsibility to ensure that the member's hours are accomplished. If a member is temporarily unable to do work at the garden due to illness, vacation or other circumstances, the Garden Master or Vice President must be informed and must approve of such absence. This is stated in the OVF Rules and Regulations.

Thank you for your attention and understanding of these rules.

OVF Membership Secretary



OVF Calendar

Work Days	General Meeting	Classes
June 13 Saturday 9 am - Noon May 31/ June 28 Sunday 1 pm - 4 pm	June 13 1:00 pm General Meeting Potluck lunch at Noon	June 20 10:30 am Worm Composting Vermicomposting Class

Garden Master Office Hours

June 2, 9-10am
June 9, 9-10am
June 16, 9-10am
June 23, 9-10am
July 7, 11-12pm
July 15, 11-12pm
July 20, 11-12pm
July 28, 9-10am

Greenhouse Fundraiser

The newly refurbished greenhouse will host a fundraiser on Saturday, June 6, starting at 10 am. The sale will feature its usual assortment of seedlings priced at $2 for a six-pack and $2 for a 4-inch pot. Cash only - small bills appreciated.

The sale will include 12 varieties of tomatoes, many of them late-slight heirlooms. Also for sale will be peppers, basil, eggplant, cucumbers, beans, lots of basil and lots of flowers. New to the greenhouse sale are green and red okra as well as cantaloupe.

An updated list of available seedlings will be published on the OVF website two weeks in advance of the sale.

OVF Native Plant Club

The first Sunday of every month from 1 pm to 3 pm, the OVF Native Plant club meets at the general meeting area. Attendance varies, and anyone is welcome at any month's get together. The club is anchored by four self-described "plant nerds" – Lars Hartvedt, Mabel Chavez, Jim Ellis, Jeff Hartman, and Philippa Moore – and activities include hands-on work in the California native plants within OVF garden as well as presentations on native plants, their ecosystems and their uses. The club has also been working with Shelley to expand their knowledge and help add care for native plants at OVF.

The club, which was initiated in January 2025 by president Shelley Kinsella and then education chair Lars Hartvedt, inherited a site along the driveway. Shelley had envisioned a native plant garden there, and Lars had designed it with Shelley. The goal is for the site, also known as the "Driveway Garden," to represent three local plant communities of the LA Basin, specifically Coastal Bluff, Coastal Sage Scrub, and Mixed Chaparral.

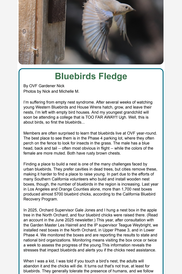
The plants selected provide year-round habitat for native insects and bird species. Lars has been working with Shelley to develop the site and has created a garden e-setting. The group selected the Lupinus arboreus (the Coastal Bryant plant community at the top couple of tiers, and is steadily moving down to the other two plant communities. Lars has been working on the site for the re-one-third planted.

As the club has met together, members weeded, moved rocks and planted new plants. The club will focus on future steps, including installing irrigation, adding signage, and creating a plant inventory. Lars has also been working on a plant inventory. The inventory is a great time to walk the site ahead of the California native planting window, which begins in the fall and lasts into the spring. There are also plans for a fundraiser event in the planning stages.

As summer winds down, the club members will search for plants that are in stock, starting at the Theodore Payne Foundation, Plant Material, and Artemisia Nursery, three great destinations for native plants.

The core leadership brings deep knowledge and interest. Precious learned about native plants from her father, Dr. Robert Ornduff, a professor at UC Riverside's Botanic Garden and volunteering with the Theodore Payne Foundation. Arthur is inspired by his wife who worked at UCLA's Botanical Gardens. Sherri's enthusiasm for native plants was sparked during a horticultural certificate from UCLA extension, and Philippa trained in botany at the University of Edinburgh. Their collective knowledge will help us educate herself on native plants, including a section on propagation.

All volunteers are welcome, regardless of knowledge or skill level. Just show up the first Sunday of the month, come regularly or not, and start the journey to experiencing native plants.



Bluebirds Fledge

By OVF Gardener Rick
Photos by Nick and Michelle M.

I'm suffering from empty nest syndrome. After several weeks of watching young Western Bluebirds and Mourse Wrens hatch, grow and leave the nest box in my backyard, I'm feeling a little down in the dumps myself. Now I'm even attending a college that is TOO FAR AWAY! Ugh. Well, this is about birds, so first the bluebirds…

Members are often surprised to learn that Bluebirds live at OVF year-round. They are not migratory birds. They stay put. They are also not the easiest species on the block to look for insects in the grass. The male has a blue head, back and tail – often most obvious in flight – while the colors of the female are more subdued, brown and gray, brown chested.

Finding a place to build a nest is one of the many challenges faced by urban bluebirds. They prefer cavities in dead trees, but as Bluebs remove these, making it harder to find a place to raise. In part due to the efforts of Bluebird Recovery Program volunteers, who build and maintain nest box boxes, though, the number of bluebirds in the region is increasing. Last year in Los Angeles and Orange Counties alone, more than 1,700 nest boxes were monitored by Bluebird Recovery Program volunteers. (Source: Bluebird Recovery Program)

In 2025, Orchard Supervisor Gabe Jones and I hung a nest box in the apple tree in the Hen Orchard, and Orchard Crew Member Jonathan Ramirez put an account in the June 2025 newsletter.) This year, after consultations with the Garden Keeper Lee Hansen and the 4th supervisor Angelica Gomez, we installed nest boxes in the North Orchard, in Upper Phase 1, and in Lower Phase 2. Bluebirds are protected by the Migratory Bird Treaty Act of 1918 and national bird organizations fiercely insists visitors to Orchard Crew or even a week to assess the progress of the young.This information reveals the different things happened between the pairs you if the nests reared assessment.

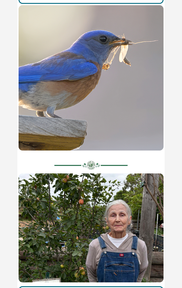
When I was a kid, I was told if you touch a bird's nest, the adults will abandon it. That is not true. Birds have a sense of smell, but it is not very acute. They generally tolerate the presence of humans, at the very fellow the protocol of Cornell University's Nestwatch program approach slowly, do not startle the adults, and they will not abandon the nest.

Because of the position of the nests in the boxes and the height of the boxes, it was tricky to see the contents of the nests, and I never entered the boxes a few times. In most of our visits, we just observed the behavior of the adults.

Bluebirds started building a nest in the North Orchard box almost immediately after I installed it. On May 1, I found the box complete and checked to see if anyone had moved into it. Nothing. Over the next few weeks in early April, their nest was complete and held five beautiful blue eggs. After that, things happened quickly. Within a week of laying, the eggs hatched. Both parents brought food back, arriving every few minutes. The chicks' fuzzy cuddly were soon replaced by the quills of feathers.

Bluebird chicks leave the nest (fledge) before they can care for themselves. They are still dependent on their parents for food and protection. They build up strength to fly and to find a new food source.

And so, in just a few more days, the nest was empty, the five fledglings were gone. They will not return to the nest box and we can only wish them well.



Notes from the Orchard

Do you think you know when an apple or a nectarine is ripe? Orchard Supervisor Gabe Jones has some tips for you. Gabe is a professional orchardist, whose career has included stints at YouTube and Intel. Inspired by Gabe's greatest from Herb Mackedie, a prominent Los Angeles County Master Gardener, Gabe transitioned to a career in fruit. Gabe is also the author of the Orchard Crew's newsletter.

For all trees in the orchard, a **READY** sign will be next to the tree, which means you can harvest **one or two pieces of fruit** to enjoy. The orchard is small and the membership is large – please remember to share.

Apples are generally ready to be harvested in late summer through the fall, depending on the variety and the weather.

One trick to figuring out if apples should be picked is that the apple releases easily from the branch with a nice twist. Even if the fruit is used a lot of pulling pressure or twisting of the stem too many times to free the apple is not ready to harvest to remain on the tree and will be ripe in a few weeks.

The bottom of the apple opposite the stem (top) should be dark brown to black. This means the seeds inside the apple are mature. Light brown seeds mean the apple has reached maturity. If the bottom is still a faint green color or a light brown, the apple isn't ready.

Finally, if there are fallen apples around the tree that usually means the apples are ready to harvest. But remember to check the tree if you are picking few trees so don't be greedy!

Stone Fruit Harvesting – stone fruit have should have lovely, sweet, fruity aromas when harvested!

Nectarines ripen from May to September with the most flavorful, peak harvest occurring in August and September. Nectarines are ready when the fem, ruit, and the background color of the skin should be yellow or yellow-white while the dominant colors should be strong and lush. The fruit should be firm but not hard when ripe. Avoid fruit that is overly soft with a dull appearance and it won't be at its sweetest and juiciest best.

Peaches can also ripen on the tree – they'll be tender to the touch – or they can be picked when still firm and ripen indoors. Peaches are ready when the skin turns from a green to a yellow or golden color as the fruit ripens. Look for a deep, uniform color on the skin. You want to avoid any green undertones, and the skin should be slightly soft but still have some firmness. They're ripe when they're fragrant. Remove the stem and apply the soft side of your thumb to dulled fruit resistance and seasoned extent before picking.

If the plant a "leggy," plant deep by digging a shallow trench and plant the seedling at a slight angle. Mix the dry ingredients listed above with the soil you dug out before refilling the hole. The entire stem will then become the roots. Water well. There is also shown to be rich and loose soil so that you get to 6 more effective.

Use a cage for support. If you plan to drive stakes for support, do it now while you know where the root ball is. (Do not drive it through the root ball later and kill the plant!)

WATER: Hydrate seedlings 2 to 3 times over the first hour, allowing at least 1 inch of water to soak into the soil each time. Then, water deeply 1 to 2 days for the first 2 weeks, every 3 to 4 days for the next 4 weeks. Do not overwater. Tomato plants draw their oxygen from the soil, and overwatering suffocates the roots. Gradually increase the hose's distance from the plant stem to force the roots to spread out. The tomato plant's soil wants to be moist and healthy. Do not let it completely dry out or get soggy.

The plant is a giant vascular system. It loves as dropping in the morning it will be ready to harvest in 60 to 80 days. Pick the fruit when it is fully red, or it is where most people make the mistake of browning. Once you see moisture meter to see if they are really in need of water. BUT…do not drive the meter through the root.

Q: How many times a week should I water?
A: Never. When the plant is dry to the touch, not on your personal schedule.

Again, use a soil moisture meter to determine if water is needed. And water the roots, not the leaves. If you can, water in the morning so that leaves and foliage at night which will attract multiple diseases including Late Blight and Smuts.

GROWTH: When the plant is 30-inches high, trim off the bottom 8 to 12-inches of leaves to increase air flow to prevent diseases and other stake-loving diseases. Keep plants pruned so that their energy is concentrated on making more fruit rather than feeding leaves.

Once blossoms develop, give each plant a good shake to help plants self-pollinate. Tomato flowers have both male and female parts on the same flower's energy. Apply the back of the vibrating head to each 90-degree blossom. Allow for 5-10 seconds. (This technique is used in cold climates with great success.)

FRUIT: Once fruit begins to set, support branches and heavy tresses. To them loosely in your tomato cage or stake. Eight-inch-wide pieces of cloth in spools and does not cut the plants. Support the tomatoes with old pantyhose or cotton products work. Avoid tying too tightly which can cut into the stems or stalk.

Fruit is ripe when it feels soft on its shoulders. Harvest before watering. Tomato plants immediately start up taking water which dissipates the flavor of the fruit. Leave tomato stems on to avoid bruising. Avoid refrigeration.

Tips on Tomatoes

The following is an updated version of the handout — written by Dean Cleveland and Nancy Ryding — for a March 2020 class at Descanso.

SITE: Plant your tomato in the sunniest area possible where it will get at least 6 to 8 hours of sunlight to develop leaves and fruit. If you can't plant may grow to be 4 to 7 feet tall.

Allow at least 30 to 36-inches in diameter for optimal growth. (Think of an adult turning with hands on hips.)

If planting in a container, use large 10 to 15 gallon size and water often. Supplement or replace its soil annually. That old soil will contain roots' detritus which is depleted of nutrients.

TRANSPLANTING: Use a good organic TOMATO supplement, such as Dr Earth's Tomato Mix. Mix in 3 cups per hole. Sprinkle a bit more with each cup of these dry ingredients: washed chicken pellets, calciumbone meal, Epsom salts, and crushed eggshells. Mix well with the soil. Remove the bottom leaves on the plant and bury the stalk to expose the stem. Be sure to around the base of plants in 3 to 4 months when each plant needs a boost.)

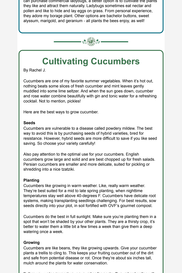
You only need the top 6 to 8 inches of the stem to have the ground after planting. Remove the lower leaves and apply the soil to the plant. Water well. Mulch fast evaporation and seaweed extract before planting.

GROWTH: When the plant is 30-inches high, trim off the bottom 8 to 12-inches of leaves to increase air flow to prevent diseases and other stake-loving diseases. Keep plants pruned so that their energy is concentrating on making more fruit rather than feeding leaves.

Once blossoms develop, give each plant a good shake to help plants self-pollinate. Tomato flowers have both male and female parts on the same flower's energy. Apply the back of the vibrating head to each 90-degree blossom. Allow for 5-10 seconds. (This technique is used in cold climates with great success.)

FRUIT: Once fruit begins to set, support branches and heavy tresses. To them loosely in your tomato cage or stake. Eight-inch-wide pieces of cloth in spools and does not cut the plants. Support the tomatoes with old pantyhose or cotton products work. Avoid tying too tightly which can cut into the stems or stalk.

Fruit is ripe when it feels soft on its shoulders. Harvest before watering. Tomato plants immediately start up taking water which dissipates the flavor of the fruit. Leave tomato stems on to avoid bruising. Avoid refrigeration.



Bugs in the Garden

By Rachel J.

As OVF gardeners know, bugs can be another nightmare along with gophers, rats and birds. While some bugs – like bees or ladybugs – are beneficial from a gardener's perspective, others munch through leaves and roots, harming the plants and sapping even sickening or killing it.

Here are some organic methods to rid your plot of bugs.

Prevention
Sometimes the best way to solve a problem is to prevent it from ever becoming a problem in the first place. Keep your garden clean, free of debris, and healthy. Don't let bugs keep your tomatoes, peppers, and other implements as clean as possible. If you're borrowing a wheelbarrow or other tools, carefully check it over before using it. And when buying seeds, look for varieties that are resistant to pests and diseases. Avoid buying diseased or misshaped seedlings, which can harbor pests or create an environment that attracts them.

Also, regularly check your plants over, so you can spot and remove bugs before they become a bigger problem.

If you're already dealing with a bug problem, pro-actively clear away any debris where bugs could be hiding. Pull weeds, rake up fallen leaves, remove those leaves to try and hide them. By picking away the damaged leaves you help keep the rest of the plant healthy.

Barriers
The good news is that the fine cloth mesh which you use to protect your plants from birds may also protect them from bugs! They will still reach the and the bees and ladybugs, so this may not be the best method for when it comes time to pollinate. Utilize mesh when your plants have fruit.

Oils
Oils are also natural insect repellents, including rosemary, neem, and peppermint. (Organic neem can be purchased from several providers on Amazon.)

You can purchase organic oils commercially. Or, you can make your own at home. Simply fill a spray bottle with water, add a few drops of oil, and shake well. Spray the solution on your plants. Be sure to spray the underside of the leaves, and then mix your oil to water in a ratio of about 1 Tablespoon to 1 gallon. Remember that oils can damage plants, so test a few leaves first. If it burns the plant leaves, we don't apply when it's hot and it gets out of direct sun. And while you can cook with these oils, they're not shelf-stable due to the water content of the leaves. Use them up within a few days.

Good Bug
Ladybugs are not just cute, they're an aphid's worst nightmare. While you can purchase commercial ladybugs, a better option is to cultivate the plants that attract them. Ladybugs love flowers, especially yarrow, marigolds, and pollen and like to hide and lay eggs in grass. Find a variety in your garden, they adore my borage plant. Other options are bachelor buttons, sweet alyssum, marigold, and geranium. If plants like bees enjoy, as well.

Cultivating Cucumbers

By Rachel J.

Cucumbers are one of my favorite summer vegetables. When it's hot out, nothing beats some slices of fresh cucumber and mint leaves gently muddled in a glass of lemonade. Or, you can add some cucumber, tomatoes and rose water combine beautifully with gin and tonic water for a refreshing cocktail. Not to mention, pickles!

Here are the best ways to grow cucumber:

Seeds
Cucumbers are vulnerable to a disease called powdery mildew. The best way to avoid this is to plant seeds that are resistant to the disease. For instance, hybrid cukes are more difficult to save if you like to seed saving. So choose your variety carefully!

Also pay attention to the optimal use for your cucumbers. English cucumbers are great for slicing, while Persian cucumbers are ideal for pickles. Pamper cucumbers are smaller and more delicate, suited for pickling or shredding into a nice tzatziki.

Planting
Cucumbers are warm weather lovers. Like, really warm weather. They're best suited for a hot, dry climate with long growing seasons. If temperatures stay well above 40 degrees F. Cucumbers have delicate root systems, so it's best to direct sow seeds rather than starting them indoors and seeds directly into your plot, or in soil that's been warmed by black plastic.

Cucumbers do the best in full sunlight. Make sure you're planting them in a spot that won't be shaded by your other plants. They are a thirsty crop, so better to water them a little bit a few times a week than give them a deep-watering once a week.

Growing
Cucumbers are the beasts, they like growing upwards. Give your cucumber plants a trellis to cling to. This keeps your fruiting cucumber out of the dirt and off the ground, preventing rot. You can also train the shoots on trellises with mulch around the plants for easier cultivation.

Before you water, inspect your cucumber for pests. Cucumber beetles will chew through the leaves of your plant and damage the fruit. Pick them off or use the organic pest control methods discussed elsewhere in the newsletter.

Harvesting
Ripe cucumbers develop a sheen to their skin. Harvest before the sheen disappears (unless you are a seed saver, in which case let your cucumber fully ripen). Cucumbers are delicate – fast handle easily, and a few watery seasons before the harvest. If the water will condense in the plant, giving your final harvest a sweeter flavor.

Community Hours Reminder

A gentle reminder to all OVF members that half of your annual 12 hours per plot of community service need to be completed by end of June. Please check your profile on the OVF website to verify how many hours you have and how many you need to complete by end of June. You can find this information by clicking on the My Account link on the upper right hand corner of the Home page.

Upcoming workdays include May 31 (Sunday, 1 pm to 4 pm); June 13 (Saturday, 9 am - noon) and June 28 (Sunday, 1 pm to 4 pm).

There is also a General Meeting on June 13 at 1 pm (preceded by a potluck at noon), for one hour's credit.

If you need other ways of meeting your work hours obligation, please contact the Garden Master or your phase rep as soon as possible.

Ocean View Farms

2026 WORKDAYS

SATURDAYS 9am-12pm	SUNDAYS 1-4pm
January 10	January 25
February 14 +Potluck & Meeting	February 22
March 14	March 29
April 11 +Potluck & Meeting	April 26
May 9	May 31
June 13 +Potluck & Meeting	June 28
July 11	July 26
August 8 +Potluck & Meeting	
September 12	September 27
October 10 +Potluck & Meeting	October 25
November 14	Member sign-in is only during the first two hours of the workday.
December 12 +Potluck & Meeting	

Potlucks start at 12pm. General meetings starts at 1pm.

Educational Opportunities

OVF Education Chair Debra Kaufman wants to know what sorts of programming and classes you'd like to see at the garden. Topics under consideration include native plant gardening, food preservation, organic pest control, and specific plant cultivation. Classes on worm composting and new member plot gardening are already scheduled for the future.

If you have a special request for a class, please email Debra at ovfdeb@gmail.com. If you have a special area of expertise and would like to teach a class, also let Debra know.

Independent Project Rules Change

At the January 2026 OVF Board meeting, the Board revised the Rules for Independent Projects to provide that members will no longer receive three community hours for the privilege of being assigned an IP. The duties and responsibilities of maintaining an IP remain the same.

Member Feedback / Submissions

If you have any feedback or comments on the newsletter, please contact OVF Education Chair Debra Kaufman at ovfdeb@gmail.com. Back issues of this and all other newsletters can be found on the OVF website.

Land Acknowledgement

Ocean View Farms recognizes that we garden on land originally and currently inhabited by the Chumash, Kizh, Tongva, and Serrano peoples. We respect them as the first caretakers of this land, with gratitude for their wisdom and skills.
